

Track Star AVLS on iPod Touch & iPhone Application Note

For users of the Track Star AVLS system who have expressed a desire for a mobile environment in which to use the AVLS Client application, the following information is provided to access the Client on either an Apple iPod® Touch or Apple iPhone® device.

The use of the AVLS Client is made possible by using a remote access software product that is available for the iPod® Touch and the iPhone® called Log Me In. The Log Me In "Ignition" product is installed on the iPod® Touch or the iPhone® and the Log Me In desktop application is installed on the desktop computer that will run the Track Star AVLS Client application.

Once the Log Me In system is installed and configured on the device and on the desktop computer, configure the mobile device for connectivity. On the iPhone® connectivity will come from AT&T Wireless while on the iPod® Touch connectivity will be via 802.11 WiFi.

With the iPhone®, use of the Track Star AVLS Client will be possible whenever and wherever data connectivity is available from AT&T. The iPod® Touch will be able to access the Track Star AVLS Client whenever it is connected to a WiFi hotspot.

To use the Client, it is necessary that the desktop computer be on and that the agent for Log Me In be running. Start the Log Me In "Ignition" application on the mobile device and log on to the desktop computer. If Track Star AVLS is already running on that computer, you can access it directly from the mobile device. If AVLS is not running, use "Ignition" to start the program and log in to the AVLS system.

Once the AVLS screen appears on the mobile device you can use standard command functions on the iPod® Touch or iPhone® to manipulate the screen display. You are able to use the Track Star AVLS software from the mobile device in this manner the same way that you would use it if you were operating the desktop computer and all of the power and functionality of the Track Star AVLS system is available to you on the mobile device. Live vehicle position updates, notifications and all other functions are fully available.

Track Star does not impose any additional licensure to use the system in this manner. It is not necessary to purchase additional Client licenses or implement any additional functions in the Track Star system for this deployment model to be implemented.

Please contact Technical Support at Track Star should you need assistance in implementing this capability.
